## Definition and Usage

The `<address>` tag defines the contact information for the author/owner of a document or an article.

If the `<address>` element is inside the `<body>` element, it represents contact information for the document.

If the `<address>` element is inside an `<article>` element, it represents contact information for that article.

The text in the `<address>` element usually renders in *italic*. Most browsers will add a line break before and after the address element.

## Browser Support

Element					
<code>&lt;address&gt;</code>	Yes	Yes	Yes	Yes	Yes

## Tips and Notes

**Tip:** The `<address>` tag should NOT be used to describe a postal address, unless it is a part of the contact information.

**Tip:** The `<address>` element will typically be included along with other information in a `<footer>` element.

---

## Differences Between HTML 4.01 and HTML5

HTML 4.01 does not support the `<article>` tag, so in HTML 4.01 the `<address>` tag always defines the contact information of the *document's* author/owner.

---

## Global Attributes

The `<address>` tag also supports the [Global Attributes in HTML](#).

---

## Event Attributes

The `<address>` tag also supports the [Event Attributes in HTML](#).

## Default CSS Settings

Most browsers will display the <address> element with the following default values:

### Example

```
address {  
  display: block;  
  font-style: italic;  
}
```
